Chemistry: Career and Employability

Dr. Sarika Arora, Dr. Ila Arora

Career means an occupation or profession, especially one requiring special training, followed as one's life work or in other words career means a person's progress or general course of action through life or a phase of life. Etymologically career is an individual journey through learning. Career comes to mean "course of one's public or professional life". Education plays an important role for making a career for an individual or giving him a "creative class". According to Behling "career of an individual may depend on three factors-

- a) Subjective factors
- b) Objective factors
- c) Critical contact

Subjective factors deal with social and psychological factors broadly including the reputation of the organization and the status of the job. Objective factors include tangible benefits of job like salary, location of job career advancement etc. critical contact advances the idea depending on the observation of candidate interaction with the organization. In brief, all these make the work-life balance required for any individual.

Every career conscious person must always keep in mind that the path chosen for a present career doesn't mean that one must have to stick with that line of work for entire life. it is required that always make a smart decision and plan to reevaluate the decision for getting long term objectives because nowadays we have many career choices in the same field to have a successful career.

A career in science now has many opportunities because it includes many career-oriented subjects and Chemistry is one of them. Studying Chemistry doesn't mean that graduate has a career in the laboratory. This subject includes many fascinating careers covering a wide industrial sector as well as an academic career after becoming a graduate in chemistry. Chemistry gives the right skills to work in any sector. A chemistry degree gives a broad range of career options.
